

实现 RouterView 组件

RouterView 的实现思路是动态渲染组件，该组件可以通过获取 current，并从 routes 中找到匹配项，渲染对应组件

```
JavaScript
import { defineComponent, getCurrentInstance, h, unref } from "vue";

export default defineComponent({
  setup() {
    return () => {
      const {
        proxy: { $router },
      } = getCurrentInstance();
      //动态获取对应组件
      let component;
      const route = $router.options.routes.find(
        (route) => route.path === unref($router.current)
      );
      if (route) {
        component = route.component
        return h(component);
      } else {
        console.warn('no match component')
        return h('div', '')
      }
    };
  },
});
```
