实现 RouterLink 组件

创建 RouterLink，RouterView

routerview 负责渲染匹配路由对应的组件

```javascript
// RouterView.js
import { defineComponent, h } from "vue";

export default defineComponent({
  setup() {
    // 先做一个占位元素
    return () => h('div', 'router-view')
  }
})
```

routerlink 渲染一个 a 标签，负责跳转

```javascript
// RouterLink.js
import { defineComponent, h, unref } from "vue";

export default defineComponent({
  props: {
    to: {
      type: String,
      required: true,
    },
  },
  setup(props, { slots }) {
    const to = unref(props.to);
    return () => h("a", { href: "#" + to }, slots.default());
  },
});
```

测试一下：

```javascript
// mini-router/index.js
import { createRouter } from "./router";

const router = createRouter({
  // history: createWebHashHistory(), // 暂时不需要
  routes,
});
```
JavaScript

```javascript
// main.js
import router from './mini-router'
```
JavaScript

mini-router

Go to Home | Go to About

router-view
